

Exterior Waterproofing

Basement Waterproofing Components

There are several components to a complete interior basement waterproofing system. All parts work together to collect and channel water into the sump basin, reducing hydrostatic pressure from the outside and pumping the water away from the house.

Because all basements are different, we will evaluate your specific needs and customize a design that will work best for your home.

Moisture Barriers

Flexi-Seal and Durawall are non-porous barriers that prevent moisture and dampness from collecting on the basement walls.

Diverters

Polydrain collects and channels water from weep holes drilled into the exterior walls to the drainage system.

Sump Pumps and Battery Backup Pumps

The Pitboss Stainless Steel 3/4 HP Primary Pump combined with the PumpSpy Battery Backup is the most comprehensive sump pump system available today.

The PumpSpy Battery Backup has patented software that monitors your primary pump, backup pump and battery.

Drainage

ICC-Approved QuikFlo Pipe (top) is placed below the floor to collect water and send it into the sump basin, where it is then pumped out.

Strip-Drain's filter fabric (bottom) protects QuikFlo from soil and other debris, creating a dual channel drainage system.
